

View of contaminated soil around process pumps. Area was graded to drain, detergent cleaned, followed with shovel construction of earthen berm.

EF-1947 is applied direct-to-earth utilizing ECOSYSTEM[®] expansion technology for secondary containment of hazardous chemicals.

View of containment area after application of EF-1947. This direct-to-earth application allows for a fast and inexpensive secondary containment system when compared to the cost and time consumed for installation of a concrete slab with a chemical resistant lining system.
